

**TÍTULO DA TESE EM INGLÊS:** The New Pangeia - Threats coming from Cyberspace

**ABSTRACT**

The present work has as its study object "The New Pangeia" and the "Threats coming from Cyberspace".

Taking as a starting point the "Continental Drift" from Wegener (1975, p.88), where he theorizes that the various continents were initially united in one, called Pangea.

And despite the physical split occurred, is possible to verify certain phenomena's that are contradicting this separation.

If to the notions of "Global Village" by McLuhan (1962), "Pangeia 2" from Schäfer (2003, p.76), "Return to Pangeia" from Rifkin (2014, p.259), we add cyberspace and the interconnection caused by it, approaching Peoples, and appealing to the notion of construction of one extended territory, we find the "New Pangeia".

The first phase of this work was to systematize the organization of this system, by standardizing their main threats, as well used means to produce damage, trying to establish correlations between conventional and cyber-attacks.

Thereafter establishing correlations between National Critical Infrastructures and the "New Pangeia", analyzing its existence, connections and mains threats.

Subsequently, making a strategic evaluation of risk either for New Pangeia and for other interconnected systems in conjunction with the analysis of the Estonian Case Study, and relevant examples occurred, allowed to deduct contributions to Strategy and Strategic decision making process.

**Palavras Chave:** Strategy, New Pangaea, Cyberspace, Internet, Security, Threats.
